

Seal & Protect

Seal & Protect provides a permanent connection between the keratin cells of the natural nail. Creates extreme adhesion for all artificial nail products and makes the natural nail stronger.

To protect the natural nail:

- Apply 2-3 layers on the natural nail for strengthening.
- Can be offered as a stand-alone nail strengthening treatment for a big client base.
- Forms an insoluble layer inside the upper layers of the natural nail, making it stronger and protected against solvents, water and other external influences.

To recover damaged nails visibly:

- Apply 2-3 layers on the natural nail.
- The keratin layers are attached to each other thereby the nails improve visible.
- Ideal for splitting nails.

For extreme adhesion:

- Apply one layer Seal & Protect and cure.
- After using Seal & Protect each acrylate attaches better, because the upper layers of the natural nail partly exist of acrylates. After the residue is removed with a dry Nailwipe, any nail product can be applied.

To attach damaged nail plate parts:

- Clean the nail with Prep & Wipe and let dry.
 - Apply Seal & Protect and let it seep between the lifted part
- loose parts do not need to be buffed off or removed, if you prep and use Seal & protect correctly they will attached back and give smooth and healthy nail appearance

How do you use Seal & Protect?

- Push back and remove the cuticle from the nail plate
- Use the Prep & Wipe dehydrator to open the keratin cells and prepare nail for Seal & Protect application
- Apply Seal & Protect in semi-dry brush, it should feel as if you have nothing on your brush at all. In fact Seal & Protect is very watery and very small amount is needed. It can easily leak, make sure you stay away from cuticle and side walls about 1 mm
- Apply it with rubbing movement to fill in the damaged parts.
- Cure in UV+LED lamp 90sec
- After polymerization carefully remove residue (until squeak) with DRY wipe

Seal & Protect

- Protects the natural nail.
- Can be offered as a stand-alone nail strengthening treatment.
- Recovers damaged nails visibly.
- Extreme adhesion.
- Attaches lifted parts.

The must have for each nail technician!
